Mock PA #1

 $AY24/\overline{25}$ Sem 2, Week 6

Fadhil Peer Mohamed <<u>f</u> p m@u.nus.edu>
Pang Yang Yi <<u>pang.yy@u.nus.edu</u>>

Timeline

WEEK	<u>LAB</u>	<u>DUE</u>
6 (this week)	Mock PA#1 (21 Feb)	2 (Project Part 1 Level 4 & 5)
Recess week		Self Practice Exercises (tentative) 3 (Project Part 2)
7 (after recess week)	PA#1	Mock PA#1 (2359 before PA#1)

Recap

orElse()

- The orElse() method should be used to help you deal with the situation where your Optional is empty, and not to prematurely strip the value out of the Optional.
- You should think of this as the "else" part of an if...else statement

orElse()

optional.map(opt -> logic handling assuming value exists)
 .orElse(opt -> logic handling if value doesn't exist)

Basic example, but this should be the structure to approach your Optionals with.

orElse()

findServer().map(server -> server).orElse(new Server(-1));

This is bad practice, and beats the point of using Optionals.

Regardless of if you are guilty of this or not, it is advisable that you start thinking of how to properly use Optionals.

Comparing Objects

- For Java to order your objects during sorting, there must be some form of priority defined
- There are 3 general ways to do this:
 - inbuilt .sort() where natural ordering is present
 - Comparable interface
 - use of a Comparator

Comparable

Some Java classes already implement **Comparable** (check Java API) Classes that you expect to have some kind of natural ordering probably implement **Comparable** (e.g. **String, Integer, Double** etc), which is why you can simply call .sort() on these

Class Integer

java.lang.Object java.lang.Number java.lang.Integer

All Implemented Interfaces:

Serializable, Comparable<Integer>

public final class Integer
extends Number
implements Comparable<Integer>

Class String

java.lang.Object java.lang.String

All Implemented Interfaces:

Serializable, CharSequence, Comparable<String>

Comparable

 Last lab, we learnt how to define priority between objects through the Comparable interface (to compare between Events through Event times)

Comparable

- By implementing the Comparable interface in our Events, Java now knows how to order your Events
- e.g. given a Stream of Events, you can sort it by calling the .sorted() function on the Stream

```
events.stream().sorted().toList();
```

 We can also use a Comparator for ordering, which allows us to sort objects that do not implement the Comparable interface

```
From the Java API:
int compare(T o1, T o2)
```

Compares object o1 with object o2 for order. Returns a

- negative integer (less than)
- Zero (equal to)
- positive integer (greater than) than object o2.

```
Given the Person class from last lab

class Person {
   int age;
   String name;

   // other code here
```

We use a separate class to implement Comparator

```
class AgeComparator implements Comparator<Person> {
    // sort by age in ascending order
    public int compare(Person p1, Person p2) {
        return p1.age - p2.age;
    }
}
```

We can create different **Comparator** classes to compare different things

```
class NameComparator implements Comparator<Person> {
    // sort by name in ascending order
    public int compare(Person p1, Person p2) {
        return p1.name.compareTo(p2.name);
    }
}
```

Comparator classes can also compare <u>multiple</u> attributes at once

```
class AgeNameComparator implements Comparator<Person> {
   // sort by age in ascending order
   // ties in age are sorted by name in ascending order
   public int compare(Person p1, Person p2) {
   if (p1.age == p2.age) {
      return p1.name.compareTo(p2.name);
   } else {
      return p1.age - p2.age;
```

 Now that we have a Comparator to define the sorting order, we pass in an instance of the Comparator as input to the sorted() function

e.g. given a Stream of people:
 Stream.of(new Person(..), ..) //initialise Stream of Persons
 .sorted(new AgeNameComparator()) //sort with Comparator
 .toList();

```
..
```

Practical Assessments

Overview

- 90 minutes
- Coding in the PE node (same thing that you do every lab)
- PA 1 is worth 15%, PA 2 20%
- Makeup PA1 will only be available if there is a valid reason for absence

How It Works

- 90mins to code your implementation during the session

 Code will be uploaded to CodeCrunch and you will be given a moderation period of about one week (usually slightly more) to modify your code for correctness

Grading

You <u>must</u> score full marks (100/100) on CodeCrunch by the end of the moderation period, or you will score `0` for your PA.

Grading

- PA Score will be based on the amount of modifications made:
 Lesser changes = Higher Score
- Full marks if you finish the PA within the 90min assessment period **and** pass all hidden test cases on CodeCrunch
- Style is **not** graded for the PA

Grading Principle

(Your code should) Convince us that you were on the right track during the 90min session, and if given more time you would have gotten the correct solution

Grading

- Comments will be ignored during grading
- Checkstyle will not be graded (minimal checkstyle will still be applied)
- You still need one file per Java class
- Functions/Variables that are unused will be deleted during grading. If you have any of these, we suggest you to delete them anyway for your own sake to make the code clearer

Specifics

PA1 Topic coverage: <u>ALL topics covered in only labs and</u> <u>exercises before PA1.</u>

- You may only use the school device in front of you
- You may refer to hardcopy notes
- You can <u>only</u> refer to the Java 21 API on the desktop (no other websites/resources/CodeCrunch)
- You are only allowed to code inside the PE nodes
- You may not bring your own keyboard

IMPORTANT

Please make sure to compile your code frequently, as we use it as a savepoint for your code should any technical fault occur.

Save your files on vim with :wq in command mode (press esc) then, in the PE node, run:

javac --release 21 --enable-preview *.java

Tips

- Allocate some time to plan and think about your program's design before writing any code (IMPORTANT!)
- Read through all levels of the PA before proceeding to have a better understanding on what you are going to code (later levels may require you to tweak your implementation)

Tips

 The amount of modifications you make to your code will determine your score - Attempt other levels if you happen to be stuck, and do not be afraid to code out "imperfect" implementations/methods/classes to minimise the amount of changes you will need!

Tips

 Variable/Function/Class names should be meaningful to help your tutors grade your work during moderation!

Mock PA #1

You are highly encouraged to read this portion of the index.pdf This will guide you on what you're allowed to use for the task.

Take note!

There are altogether five levels. You are required to complete ALL levels.

You should keep to the constructs and programming discipline instilled throughout the module.

- Write each class/interface in its own file.
- . Ensure that ALL object properties and class constants are declared private final.
- Ensure that that your classes are NOT cyclic dependent.
- Use only java libraries taught in class.
- You are NOT allowed to use java keywords/literals: null, instanceof (except within the typical equals method)
- · You are NOT allowed to use Java reflection, i.e. Object::getClasses and other methods from java.lang.Class
- You are NOT allowed to use * wildcard imports.
- You are NOT allowed to define array constructs, e.g. String[] or using ellipsis, e.g. String...

You may assume that all tests provide valid arguments to methods; hence there is no need to validate method arguments.

Mock PA #1

No walkthrough today - this lab will be considered a mock PA

Must at least attempt and compile level 1. javac --release 21 --enable-preview *.java

Mock PA still subjected to the usual checkstyle.

Deadline: 6 Mar 2359 (Night before PA #1)
